Weeks. The machine will create a wall 35 deep into the clay layer to form a lining for the remediation. JCP&L \* Environmental Project Engineer Frank Lawton said it would be an indispensable tool.

"Everything in there will stay, he contained within," he said. In addition, a foot of soil will be removed from the surface and replaced with new soil. Lawton said. He said a gravel con-
struction process was to be built to ensure any dirt from the work area wasn’t carried out on roadways. A decontamination area will be built on a pad laid where wheels of dump trucks carrying soil from the site will be washed. Two structures from the gas plant remain under- ground but their contents will be removed. One part of a gas holding tank. The holder will remain un-derground but its contents will be cleaned out, according to Lawton. He said impurities accumulated in the bottom of holding tanks that stored the finished gas. Caballero said the stor-
age tank, which measures about 66 feet by 40 feet, will be completely removed.

The initial phase called for reclamation of the wetlands by cleaning out 10 feet by 10 feet filled with charcoal to de-
tegrate water. Lawton said extraction of water will be visible from the wetlands, it will prevent any water from seeping into the wet-
land," he said. Current plans call for discharging the treated water onto land and let it infiltrate.

"Everything in there will stay, he contained within," he said. In addition, a foot of soil will be removed from the surface and replaced with new soil. Lawton said. He said a gravel con-
struction process was to be built to ensure any dirt from the work area wasn’t carried out on roadways. A decontamination area will be built on a pad laid where wheels of dump trucks carrying soil from the site will be washed. Two structures from the gas plant remain under-

derground but its contents will be cleaned out, according to Lawton. He said impurities accumulated in the bottom of holding tanks that stored the finished gas. Caballero said the stor-
age tank, which measures about 66 feet by 40 feet, will be completely removed. Caballero said the sec-
ond containment wall inside the first containment wall will be taken pak-
king place.

Then we have these extraction wells on the surface to collect water, it will prevent any water from seeping into the wet-
land," he said. Current plans call for discharging the treated water onto land and let it infiltrate.
