JCP&L containment wall complete

The primary containment wall has been installed at the site of the former manufactured gas plant in Cape May. The project is expected to be completed in mid-October, when the remediation efforts will begin. The wall is part of a larger effort to clean up the contamination at the site, which is considered to be a threat to public health and the environment.

The wall is made of a special concrete mix that is designed to prevent the leaching of contaminants. It is also lined with an impermeable liner to further reduce the risk of contamination. The wall will be capped with a concrete cap to prevent further movement of contaminants. The project is expected to be completed in mid-October, when the remediation efforts will begin.
